

MVP Definition

What the first version of Bayanuk does, for whom, and how we know it works.

Product	Bayanuk (بيانك), AI review of job offers and employment contracts
Owner	JX Tech Studio
Version	1.0 (draft for team review)
Date	October 2026

1. Product overview

Bayanuk (بيانك, "your clarification") is a web platform that helps employees and job seekers understand employment documents before they sign them. The user uploads a job offer or an employment contract, and Bayanuk extracts the important terms, explains them in plain language, highlights the clauses that deserve attention, and answers questions about the document with a reference to the page the answer came from.

One-line promise: Understand your job offer before you sign.

Arabic: افهم عرضك الوظيفي قبل أن توقع.

This document defines what the first version (the MVP) must do, for whom, and how we will know it works. It describes the product, not the task split; tasks are defined in the Planning & Execution Plan.

2. Problem

People receive offers and contracts that run from 2 to 30 pages, often mixing Arabic and English and using legal wording. Before signing, they usually cannot answer simple but important questions quickly:

- Is the salary in the offer the actual monthly amount I will receive, and what is basic versus allowances?
- Is there a probation period, and how long is the notice period if I resign?
- Is there a non-compete clause, penalties, or deductions?
- What benefits were promised (leave, medical insurance, tickets, bonus), and are any missing?
- If I have two offers, which one is actually better once everything is added up?

Reading every clause takes time, and asking a lawyer for every offer is not realistic for most people, especially fresh graduates. The result is that people sign documents they do not fully understand.

3. Target users

Segment	Description	Priority
Fresh graduates	First job offer, little experience with contract terms. Highest need, highest willingness to share the product.	Primary
Job switchers	Comparing a new offer to their current job or to a second offer.	Primary
Employees on renewal	Received a renewed contract, amendment, or promotion letter and want to see what changed.	Secondary (post-MVP document types)
Recruiters and HR agencies	Need to review many contracts quickly. Served later through a B2B API.	Future

Market focus for launch: Saudi Arabia, with full Arabic and English support from day one. Arabic documents get the same level of support as English ones; this is a core requirement, not an add-on.

4. MVP scope

4.1 Supported documents

Document type	In MVP	Notes
Job offer (عرض وظيفي)	Yes	Usually 1 to 4 pages. Main entry point for most users.
Employment contract (عقد عمل)	Yes	Usually 5 to 30 pages. Richer clauses and risk points.
Freelance contract, NDA, internship agreement, amendment, termination agreement	No	Planned after MVP in this order of demand.
Rental, commercial, or any non-employment contract	Never (for this product)	Rejected politely with a clear message.

4.2 In scope

- Upload of PDF and DOCX files (up to 10 MB and 30 pages).
- Automatic check that the file is a job offer or employment contract, with a polite rejection otherwise.
- Extraction of key employment terms into structured data (see section 6).
- A plain-language summary in the user's interface language, whatever the document language.
- Attention points: clauses and gaps that deserve a closer read (see section 7).
- "Ask your document": a chat that answers only from the document and cites the page.
- A side-by-side document viewer that jumps to the cited page.
- Guest mode: upload and see results without an account; sign in to save, chat longer, or compare.
- Sign-in with email magic link or Google.
- Delete document at any time, plus automatic deletion after a retention period.
- Bilingual interface (Arabic RTL and English LTR), responsive on mobile.

4.3 Out of scope for the MVP

- Any document type outside job offers and employment contracts.
- Legal consultation or any statement that a clause is legal or illegal.
- Mobile apps (the web app must work well on mobile browsers instead).
- Payments and subscriptions (the business model is tested after the MVP; see the Planning Plan).
- Team accounts, organizations, and the B2B API.
- Fine-tuning or hosting our own AI models.
- Editing the user's document or generating new contracts.

5. Core user flow

- 1 Landing.** The user sees the promise, the privacy message, and one upload button.
- 2 Upload.** The user drops a PDF or DOCX. The file is validated (type, size, pages) before anything else happens.
- 3 Processing.** A progress screen shows clear stages: Checking file, Reading document, Finding key terms, Looking for points that need attention. Typical time target: under 60 seconds.
- 4 Result dashboard.** Overview (document type, contract type, duration, probation, notice period, total monthly pay), then key-term cards (compensation, working hours, leave, contract), then attention points, then the summary.
- 5 Ask.** Suggested questions are shown as chips ("What is my notice period?", "Can I resign during probation?"). Each answer cites the page and a short quote.
- 6 Save or delete.** Guests are invited to sign in to keep the analysis. Every user sees a clear Delete document button.

6. Extracted fields

The AI returns structured JSON, never free text, for the fields below. Every extracted value carries the page number and a short source quote so the user can verify it. A value that is not found is returned as "not found", never guessed.

Group	Field	Example
Document	document_type, language, employer_name, job_title	employment_contract, ar, "Company X", "Accountant"
Contract	contract_type, start_date, duration_months, renewal terms	fixed_term, 2026-11-01, 12, auto-renew
Probation	probation_days, extension allowed	90, yes
Notice	notice_period_days (employee and employer, if different)	30 / 60
Compensation	basic_salary, housing, transportation, other allowances[], total_monthly, currency, pay frequency	8,000 / 1,500 / 500 / [] / 10,000 / SAR / monthly
Working time	hours_per_week, working_days, overtime terms	48, Sun to Thu, paid per law
Leave	annual_leave_days, other leave mentioned	21
Benefits	medical insurance, tickets, bonus, training, end-of-service mention	medical: yes (family)
Restrictions	non_compete (exists, duration, scope), confidentiality, exclusivity	yes, 12 months, same sector
Termination	termination conditions, penalties, deductions, training-cost repayment	repay training if leaving within 1 year

Personal identifiers in the document (national ID, iqama number, IBAN, phone number) are not extracted, are masked before text is sent to the AI provider, and are never shown in analytics.

7. Attention points

Attention points are what make Bayanuk more than a summary. They are produced by two layers: deterministic rules on top of the extracted fields (testable and predictable), and AI clause detection for wording that rules cannot catch. Each point has a category, a severity, a short "why it matters" explanation, and a page reference.

Category	Trigger (starting rule)	Severity
Non-compete	A non-compete or non-solicitation clause exists.	Attention
Long notice period	Notice period longer than 60 days.	Attention
Long probation	Probation longer than 90 days, or extendable.	Attention
Penalties and deductions	Clause allows deductions, fines, or repayment (for example, training costs).	Attention
Salary does not add up	Components do not match the stated total, or currency is unclear.	High
Missing key information	No salary, leave, working hours, or contract duration found.	Info or High (salary)
One-sided change	Employer may change role, location, or pay unilaterally.	Attention
Unusual working time	More than 48 hours per week stated as normal hours.	Attention

Wording rule: Bayanuk never says a clause is "illegal" or "unfair". It says what the clause means, why it may matter, and suggests reading it carefully or asking a specialist. All thresholds are a starting point, are stored in configuration, and are reviewed against Saudi Labor Law by a qualified person before public launch.

8. "Ask your document" chat

- Answers come only from the uploaded document (retrieval-augmented generation). General knowledge is not used to fill gaps.
- Every answer cites at least one page and a short quote. Clicking the citation opens the viewer on that page.
- If the answer is not in the document, the reply says so clearly instead of guessing.
- Questions that ask for legal judgment ("Can I sue them?") get a polite boundary and a suggestion to consult a specialist.
- The reply language follows the user's question language.
- Limits: guests get 3 questions per document; signed-in users get 20 per document in the MVP.

9. Trust, privacy and disclaimers

Trust is the main adoption risk: users upload documents that include their salary and personal details. The product must make privacy visible, not just promise it.

- Documents are never used to train AI models. AI providers are configured with data-retention options that do not keep our requests where available.
- Files are stored privately and encrypted at rest; access is through short-lived signed URLs only.
- Delete document removes the file, extracted text, analysis, and chat history immediately.
- Automatic deletion: guest documents after 24 hours, signed-in documents after 30 days unless the user chooses to keep them.
- A visible disclaimer on every result page: "Bayanuk provides AI-generated information to help you understand your document. It is not legal advice."

10. Non-functional requirements

Area	Requirement
Performance	Result ready in under 60 seconds for a 10-page text PDF (90th percentile). Chat answer under 8 seconds.
Languages	Arabic and English documents and interface; mixed-language documents handled. Arabic numerals (٠ ١ ٢ ٣) normalized.
Scanned documents	Image-only PDFs are supported through OCR, with a notice that accuracy may be lower.
Accessibility	Keyboard usable, visible focus, text contrast at least 4.5:1, works at 360 px width.
Reliability	Failed analyses show a clear reason and a retry; no silent failures.
Cost	AI cost per analysis tracked from day one; target set after the first 50 real analyses.
Security	See the Technical Plan, section 8.

11. Success metrics

Metric	Why it matters	MVP target
Upload to result rate	Of people who start an upload, how many reach the result page. Measures trust and UX.	70% or more
Landing to upload rate	Of visitors, how many upload. Measures the promise and the privacy message.	15% or more
Analysis failure rate	Share of uploads that end in an error.	Under 5%
Extraction accuracy	Correct key fields on our golden test set of real-style contracts.	90% on core fields
Helpful rating	Thumbs-up share on results.	75% or more
Questions per document	Engagement with the chat.	2 or more
Returning users (30 days)	Whether people come back for a second document.	Tracked, no target yet

12. Definition of Done for the MVP

- 1 A guest can upload an Arabic or English job offer or contract and reach the result dashboard.
- 2 All fields in section 6 are extracted when present, each with page and quote, and "not found" when absent.
- 3 Attention points in section 7 are produced and each links to its page.
- 4 The chat answers from the document with citations, and says when the answer is not in the document.
- 5 A non-employment document is rejected politely.
- 6 Delete document and automatic deletion work and are verified by tests.
- 7 The interface works in Arabic and English on desktop and mobile.
- 8 Accuracy on the golden test set is measured and reported (the target guides iteration; it does not block launch).

13. After the MVP

Phase	Feature
MVP+	Compare two offers side by side with an AI summary of the difference.
MVP+	Downloadable PDF report of the analysis.
Growth	Free tools hub: salary calculator, notice period calculator, annual compensation calculator.
Growth	More document types: freelance, NDA, internship, amendment, termination.
Revenue	Pay-per-report and a Pro plan (see the Planning Plan).
B2B	API for recruitment agencies and HR teams.

Open questions

- Final English spelling and domain (Bayanuk) and whether to launch on a studio subdomain first.
- Who performs the legal review of attention-point thresholds before public launch.
- Retention defaults (24 hours and 30 days) to be confirmed together with the privacy policy.
